

Full name: \_\_\_\_\_

**Final test – Winter term 2023/24**  
**Variant D**

In every problem, justify all steps properly.

1. (4 points) Find the limit

$$\lim_{n \rightarrow \infty} \frac{2n(\sqrt{n^2 + 4n + 5} - \sqrt{n^2 - 3})}{\sqrt{n^2 + 3n + 1}}.$$

2. (4 points) Find the derivative of the function

$$f(x) = \frac{e^{2-3x}}{4x + 2}$$

and find the domain of definition of the function  $f(x)$  and of its derivative  $f'(x)$ .

3. (12 points) A parabola is given as a graph of the function  $f(x) = -\frac{1}{2}x^2 - x + 4$ . Find all points  $x_0 \in \mathbb{R}$  at which the tangent line to the parabola has its slope equal to  $-2$ . At every such point, find the equation of the tangent. Draw the parabola including its intercepts with the axes and vertex. Draw the previously found tangent line into the same picture, including its intercepts with the axes and its contact point with the parabola.

4. (20 points) Examine the course of the function

$$f(x) = x^4 - 16x^2$$

i.e. find its domain of definition  $D_f$ , limits at endpoints of  $D_f$ , intercepts with axes, derivative of  $f$ , intervals of monotony, global and local extrema, intervals of convexity and concavity, asymptotes. Draw the graph.

Hint:  $\sqrt{8} \doteq 2,82$ ,  $\sqrt{\frac{8}{3}} \doteq 1,63$ .

5. (20 points) Find the extremes of the function  $f(x, y) = \frac{5}{2}x^2 + 6y$  on the set

$$M = \{[x, y] \in \mathbb{R}^2 : x^2 + y^2 \leq 25, 4y \leq 3x, y \leq 0\}.$$

For candidates at the curved part of the boundary of  $M$  (except for vertices), find the value of  $\lambda$ . Draw the set  $M$  including all candidates for an extreme.
